

I will define below interface definition to allow user to save the object on multiple devices based on destinationDevice parameter. And this interface will support find, save, delete, update methods to retrieve, create, update and remove a record on destination device.

<i>&lt;&lt;Interface&gt;&gt;</i> <b>PersistInformation</b>
+ uniqueId: String + destinationDevice: String
+ find(string uniqueId): Array + save(String uniqueId) + delete(String uniqueId) + update(String uniqueId)
